"Over a thirty-year period I consulted with numerous surgeons across Europe, Middle East, and the USA. They all seemed to chant the same solution to my desperate cry for help. I would be left with an ugly lollipop/vertical scar which I did not want."

"The Bellesoma Method proved them all wrong and I couldn't be happier with the results."

- Veronica L., Dubai

BreastReduction

BY BELLESOMA

Finally, the reduction you want...without the scars you don't.

BellesomaTM
THE ULTIMATE BREAST METHOD

Have you considered a breast reduction but put it off after learning about the tradeoffs?

Women often choose a breast reduction to alleviate chronic pain, find clothing that fits, avoid unwanted attention and improve their overall self-esteem.

If you have considered traditional breast reduction techniques, but have concerns over the unsightly vertical scars and poor post-operative shape, you may want to consider the breakthrough Bellesoma Method.

How is the BellesomaTM Method different?

- Does not produce an unsightly vertical scar
- Transfers the weight of the breast to the chest muscle providing immediate relief of back, neck, and shoulder pain - massive reduction not required for pain relief
- Lifts and shapes the breast using an internal suspension technique resulting in a beautiful post-surgical appearance
- Preserves the ability to breast feed

"I had numerous surgeon consultations in the UK & had searched the world over for a surgeon that could fix me without the big lollipop scar. Nearly hung my hat up...then I found Bellesoma! The final work is so good that no UK surgeons believed what they were seeing!"

- Cindy S., England

How the Bellesoma Method works

BEFORE

Typical female patient with excessively large breasts and suffers from the pain in the back, neck, and shoulder area.

PHASE 1

Excess fat & tissue is removed based on patient desires and new breast mounds are created and positioned high on the chest wall to create a beautiful post-op appearance.

PHASE 2

The new breast mounds are secured to the chest muscle transferring the weight away from the skin envelope creating immediate relief of back, neck, and shoulder pain.

PHASE 3

The final sutures are put in place around the areola and within the shadow of the breast leaving no ugly vertical scars.

AFTER

The surgery is successfully completed and results are immediately visible. In time, post-surgical swelling will resolve and incision lines will fade as the patient fully enjoys the desired outcome.
